

1. WAP in C++ to find factorial of a number using functions
- No argument no return value
  - with argument no return value
  - no argument with return value, - with argument with return value

```
#include <iostream>
```

```
using namespace std;
```

```
void fact()
```

```
{
```

```
    int n;
```

```
    int k=1;
```

```
    cout << "Enter the no. from you want the factorial" << endl;
```

```
    cin >> n;
```

```
    for (int i=1; i<=n; i++)
```

```
    {
```

```
        k = k * i;
```

```
    }
```

```
    cout << "The factorial of " << n << " with no argument and
```

```
    return value is " << k << endl;
```

```
}
```

```
void factorial(int n)
```

```
{
```

```
    int y=1;
```

```
    for (int i=1; i<=n; i++)
```

```
    {
```

```
        y = y * i;
```

```
    }
```

```
    cout << "The factorial of " << n << " with argument and no
```

```
    return value is " << y << endl;
```

```
}
```

```
int factorialreturn()
```

```
{
```

```
    int n;
```

```
    int k=1;
```

```
    cout << "Enter the no. from you want the factorial" << endl;
```

```
    cin >> n;
```

```
    for (int i=1; i<=n; i++)
```

```
    {
```

```
        k = k * i;
```

```
    } return k;
```

```
}
```

```
int f(int n)
```

```
{ int y=1;
```

```
  for (int i=1; i<=n; i++)
```

```
  { y = y * i;
```

```
  }
```

```
  return y;
```

```
}
```

```
int main(){
```

```
  fact();
```

```
  int p, q;
```

```
  cout << "Enter the no. from you want the factorial" << endl;
```

```
  cin >> p;
```

```
  factorial(p);
```

```
  int m = factorialreturn();
```

```
  cout << "The factorial of is no argument and with return value" << m << endl;
```

```
  cout << "Enter the no. from you want the factorial" << endl;
```

```
  cin >> q;
```

```
  int l = f(q)
```

```
  cout << "The factorial with argument and return value of is " << l << endl;
```

```
  return 0;
```

```
}
```

Output

Enter the no. from you want the factorial

5

The factorial of 5 with no argument and return value is 120.

Enter the no. from you want the factorial

4

The factorial of 4 with argument and no return value is 24.

Enter the no. from you want the factorial

3

The factorial of is no argument and with return value is 6.

Enter the no from you want the factorial

2

The factorial with argument and return value of is 2.

Q2 WAP in C++ using function that gives two nos. and display prime no. b/w them.

```
#include <iostream>
```

```
using namespace std;
```

```
int checkPrimeNumber (int n);
```

```
int main() {
```

```
    int n1, n2, i, f1;
```

```
    cout << "Enter two positive integers : " << endl;
```

```
    cin >> n1 >> n2;
```

```
    cout << "Prime numbers between " << n1 << " and " << n2 << " are:" << endl;
```

```
    for (i = n1 + 1; i < n2; ++i)
```

```
    { f1 = checkPrimeNumber(i);
```

```
        if (f1 == 1)
```

```
            cout << " " << i;
```

```
    }
```

```
    return 0;
```

```
}
```

```
int checkPrimeNumber (int n)
```

```
{
```

```
    int j, f1 = 1;
```

```
    for (j = 2; j <= n/2; ++j)
```

```
    { if (n % j == 0) {
```

```
        f1 = 0;
```

```
        break;
```

```
    }
```

```
    return f1;
```

```
}
```

Output - Enter two positive integers:

1 20

Prime numbers between 1 and 20 are;

2 3 5 7 11 13 17 19

3. WAP in C++ using functions to add, subtract, multiply, and divide two complex numbers

```
#include <iostream>
```

```
using namespace std;
```

```
void result (int a, int b, int c, int d1)
```

```
{ cout << "The number is " << a << "+" << b << "i" << endl;
```

```
  cout << " the number is " << a1 << "+" << b1 << "i" << endl;
```

```
}
```

```
void sumcomplex (int a, int b, int a1, int b1)
```

```
{ int int k, m;
```

```
  k = a + a1;
```

```
  m = b + b1;
```

```
  cout << " the sum is " << k << "+" << m << "i" << endl;
```

```
}
```

```
void productcomplex (int a, int b, int a1, int b1)
```

```
{ int k, m;
```

```
  k = a * a1 - b * b1;
```

```
  m = a * b1 + b * a1;
```

```
  cout << " the product number is " << k << "+" << m << "i" << endl;
```

```
}
```

```
void subtractcomplex (int a, int b, int a1, int b1)
```

```
{ int k, m;
```

```
  k = a - a1;
```

```
  m = b - b1;
```

```
  cout << " the subtraction is " << k << "+" << m << "i" << endl;
```

```
}
```

```
void divideComplex (int a, int b, int c, int d)
```

```
{ float k = (a * c + b * d);
```

```
  float l = (c * c + d * d);
```

```
  float i = (b * c - a * d);
```

```
  cout << " The division of complex number is " << k / l << "+" << i / l << "i" << endl;
```

J. Daman

2005839

```
int main()
```

```
{
```

```
    int a, b, c, d;
```

```
    cout << "Enter the real part of 1st complex no." << endl;
```

```
    cin >> a;
```

```
    cout << "Enter the imaginary part of 1st complex no." << endl;
```

```
    cin >> b;
```

```
    cout << "Enter the real part of 2nd complex no." << endl;
```

```
    cin >> c;
```

```
    cout << "Enter the imaginary part of 2nd complex no." << endl;
```

```
    cin >> d;
```

```
    result(a, b, c, d); result(a, b, c, d);
```

```
    sumcomplex(a, b, c, d); sumcomplex(a, b, c, d);
```

```
    productcomplex(a, b, c, d);
```

```
    subtractcomplex(a, b, c, d);
```

```
    dividecomplex(a, b, c, d);
```

```
    return 0;
```

```
}
```

Output= Enter real part of 1<sup>st</sup> complex no.

1

Enter the imaginary part of 1<sup>st</sup> complex no.

2

Enter the real part of 2<sup>nd</sup> complex no.

3

Enter the imaginary part of 2<sup>nd</sup> complex no.

4

The number is  $1 + 2i$

The number is  $3 + 4i$

The sum is  $4 + 6i$

The product number is  $-5 + 10i$

The subtraction is  $-2 + (-2i)$

The division of complex number is  $0.44 + 0.08i$

J Daryan

Q. 9 WAP in C++ using a recursive function that adds first  $n$  natural no.

```
#include <iostream>
```

```
using namespace std;
```

```
int sum(int n)
```

```
{ if (n == 0)
```

```
{ return 0;
```

```
}
```

```
return n + sum(n-1);
```

```
}
```

```
int main()
```

```
{ int n, k;
```

```
cout << "Enter the number upto which you want the sum" << endl;
```

```
cin >> n;
```

```
k = sum(n);
```

```
cout << "The sum of "<< n << " numbers is " << k << endl;
```

```
return 0;
```

```
}
```

Output -

Enter the number upto which you want the sum

10

The sum of 10 numbers is 55.
